

MORIMOTO

Side Emitting LED Strips

Step one: you will mount the LED strip to your headlights by peeling off the sticky back-side and applying it to a clean surface. Preparing the surface with rubbing alcohol or even just a clean cloth to ensure no dust/oils etc are there will ensure a more permanent stick.

If the strip needs to be cut down in length, you can do so every 3 LED's (indicated by a picture of scissors). If cut elsewhere, LED's before or after the cut may not light up.

Step Two: Connect one 12v positive (+) lead to one wire, and a ground (-) wire to the second wire. If the LED strip does not light up, swap the wires. (they are polarity sensitive, but not marked)

Notes:

- Connecting the input wires on the strip backwards will not harm it.
- Crimp on splices will help you tap into the corner/parking lights that most individuals use to power the LED strips. (these are not included, but available at most auto stores or radio shack)
